

### AMENDMENTS TO THE CLAIMS

1. (Currently amended) An integrated circuit implementing at least one operator involving at least one secret quantity, and functionally comprising upstream and downstream of the operator at least ~~one~~first and second source registerregisters and at least one destination register, respectively, at least one temporary register ~~to store a content of the source register or a result of the operator before transfer to the destination register, and means for loading a random or pseudo-random number at least into the destination register, means for loading a first random or pseudo-random number into the temporary register, means for transferring the content of the first source register to the temporary register, and means for loading a second random or pseudo-random number into the destination register, the operator combining the content of the second source register and the temporary register and storing the result in the destination register.~~

2. (Original) The circuit of claim 1, wherein said random number is loaded into the destination register before transfer of a result of the operator to this register.

3. (Canceled)

4. (Currently amended) An antifraud method comprising randomizing a content of a destination register of a result of an operator involving at least one secret quantity, and inputting a random quantity in the destination register before each loading of a result therein, ~~the result of the operator being transferred to a temporary register before loading into the destination register~~further comprising loading a first random or pseudo-random number into a temporary register, transferring the content of a first source register to the temporary register, loading a second random or pseudo-random number into the destination register, the operator combining the content of a second source register and the temporary register and storing the result in the destination register.

5. (Canceled)

6. (Currently amended) An integrated circuit comprising:  
an operator configured to perform an operation on a secret quantity;  
a destination register coupled to receive a result of the operation;  
~~a control circuit configured to load a random or pseudo-random number into the destination register before transfer of the result into the destination register, to protect against attacks by physical signature analysis;~~  
~~a first and second source registers; register coupled to provide data to the operator; and~~  
~~a temporary register; and configured to store the data of the source register or the result of the operation, wherein the control circuit is further configured to load a random or pseudo-random number into the temporary register~~  
a control circuit configured to load a first random or pseudo-random number into the temporary register, to transfer the content of the first source register to the temporary register, and to load a second random or pseudo-random number into the destination register, the operator combining the content of the second source register and the temporary source register and storing the result in the destination register.

7.-10. (Canceled)

11. (Original) An integrated circuit as defined in claim 6, wherein the destination register is a source register for a second operator.

12. (Currently amended) An antifraud method comprising:  
randomizing a content of a destination register coupled to receive a result of an operation involving a secret quantity before transfer of a result into the destination register, to protect against attacks by physical signature analysis, ~~wherein randomizing the content of the destination register comprises loading a random or pseudo-random number into a temporary register, transferring the result of the operation to the temporary register, loading a random or pseudo-random number into the destination register and transferring the result from the temporary register to the destination register~~further comprising loading a first random or pseudo-random number into a temporary register, transferring the content of a first source register to the temporary register, loading a second random or pseudo-random number into the destination

register, the operator combining the content of a second source register and the temporary register and storing the result in the destination register.

13.-16. (Canceled)

17. (Original) An antifraud method as defined in claim 12, further comprising using the destination register as a source register for a second operation.

18. (Currently amended) An antifraud method comprising:  
loading a first random or pseudo-random number into a temporary register;  
transferring the content of a first source register to the temporary register;  
performing an operation on a secret quantity to produce a result, the operation combining the content of a second source register and the temporary register;

loading a random or pseudo-random number into a destination register that is coupled to receive the result of the operation, to protect against attacks by physical signature analysis; and  
transferring the result of the operation into the destination register[[:]]  
~~loading a random or pseudo-random number into a temporary register;~~  
~~transferring the result of the operation to the temporary register, and~~  
~~transferring the result of the operation from the temporary register to the destination register.~~

19.-20. (Canceled)
